

L'Analisi dei Requisiti nel Processo di Usability Engineering Modeling Users: Personas and Goals

Corso di Informatica – Laurea Magistrale
Prof.ssa Giuliana Vitiello

Topics

- Why Model?
- Personas
- Personas as a Design Tool
- Personas vs. User Roles
- Personas vs. Market Segments
- User vs. Non-User Personas

Topics

- Goals
- User Goals
- Non-User Goals
- Constructing Personas
- Persona Types
- Other Models
- Questions & Discussion

Why Model?

- Represent complex structures, relationships
- Increased understanding, visualization
- Based on raw, observed behavior
- Synthesize data patterns

Personas

- Help identify specific users and needs
- Identify primary, secondary users
- Helps choose the right individuals to design for

Personas as a Design Tool

- Identify what the product should do
- Determine a product's behavior
- Facilitates communication with stakeholders
- Builds consensus and commitment
- Measures design effectiveness

Personas as a Design Tool

- Contributes to marketing and sales
- Help resolve
 - Elastic user
 - Self-referential design
 - Design edge cases

The Elastic User

- Each designer has own idea of end user
- User definition becomes elastic to fit designer
- Real users are not elastic

Self-Referential Design

- Designers project own goals onto product
- We tend towards technology for its own sake

Design Edge Cases

- Possible situations
- Usually not experienced by target personas
- Must be programmed for
- Not the design focus

Personas are Based on Research

- Interviews with users
- Information from stakeholders
- Information from SMEs
- Market research data
- Market segmentation models
- Literature reviews

Personas are Represented as Individuals

- User models treated as actual individuals
- Represented as specific individuals
- Considered as real users
- Represent classes of users in context
- Context specific

Personas are Represented as Individuals

- Not reusable across products
- Not archetypes or stereotypes
- Do not represent an average user
- Represent user examples
- May have a collection or cast of personas for a product

Personas vs. User Roles

- Some similarities
 - Seek to describe relationships of users to products
- Roles are abstractions
- Personas address goals
- Personas are more holistic models

Personas vs. Market Segments

- Market segments are based on
 - Demographics
 - Distribution channels
- Personas are based on
 - Behaviors
 - Goals

User vs. Non-User Personas

- Non-user personas include
 - Product reviewers
 - Columnists
 - IT Managers
 - Purchasing agents
- Driven by business goals

Goals

- Drivers behind user behaviors
- Addressed via tasks
- Provide answers to product usage motivation
- Inferred from qualitative data
- Expressed as simple sentence

Types of Goals

- First priority in design
- Goals may be different for:
 - Organizations
 - Employers
 - Customers
 - Partners
 - End users

User Goals

- Life goals
 - Become an expert in my field
 - Get promoted quickly
 - Exhibit ethics and trust

User Goals

- Experience goals
 - Don't feel stupid
 - Minimize or eliminate mistakes
 - Feel competent and confident
 - Enjoy the product's use

User Goals

- End goals
 - Find the best price for a product
 - Finalize a press release
 - Process customer orders
 - Create software

Non-User Goals

- Customer
 - Parents, relatives, friends
 - IT Managers, purchasers, management
- Security
- Maintenance
- Customization
- Installation

Non-User Goals

- Corporate
 - Increase profit
 - Increase market share
 - Defeat competition
 - Use resources efficiently
 - Offer more products or services

Non-User Goals

- Technical goals
 - Minimize memory use
 - Run in a browser
 - Safeguard data
 - Execute efficiently
 - Cross platform usage/consistency

Constructing Personas

- Incorporate information about
 - Goals
 - Attitudes
 - Work or activity flow
 - Environment
 - Skills and levels
 - Frustrations

Constructing Personas

- Revisit the personal hypothesis
- Map interviews to behavioral variables
- Identify significant behavior patterns
- Synthesize characteristics and goals
- Check for completeness
- Develop narratives
- Designate types

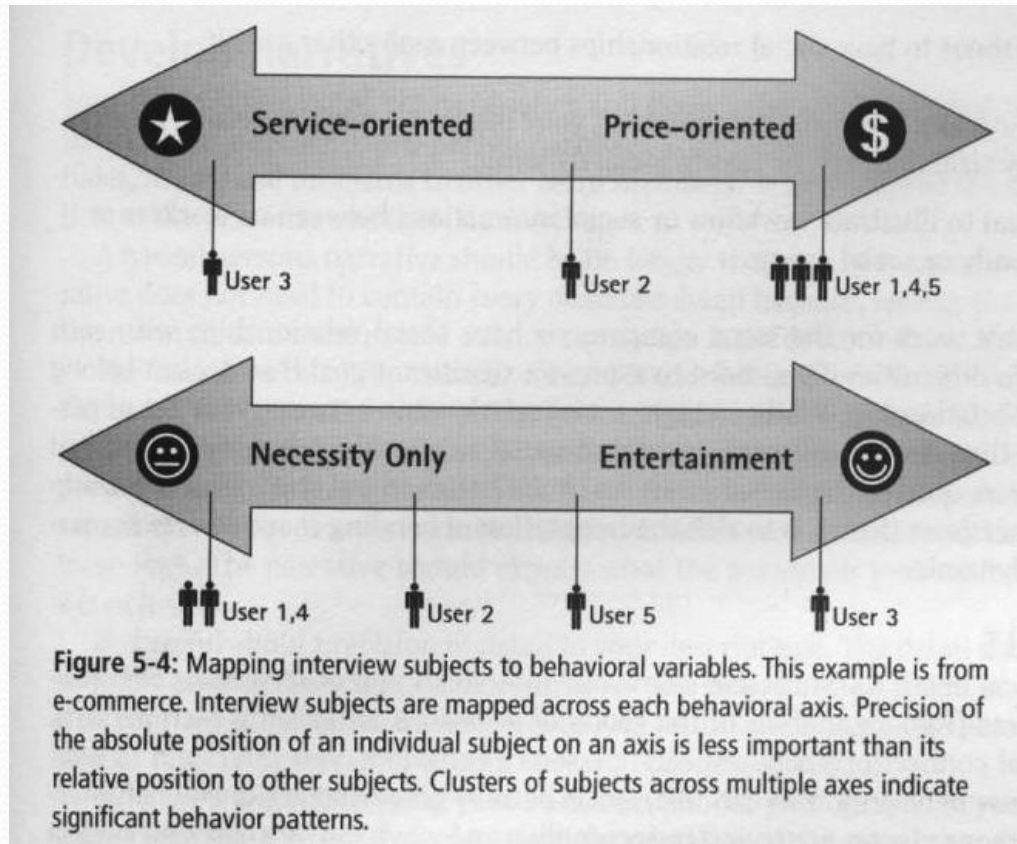

Revisit The Personal Hypothesis

- Compare patterns to assumptions
- Do not focus on demographics
- Behavioral variables are paramount
- 15 – 30 variables per role are typical

Map Interviews To Behavioral Variables

- Map interviewee against variable range
- Precision is not critical
- Relative placement is the goal

Mapping Subjects to Variables

Handset upgrade mindsets

Behavioral Variables

Identify Significant Behavior Patterns

- Clustering of subjects may ID persona
- Clustered behaviors must be causal

Synthesize Characteristics And Relevant Goals

- Describe such things as
 - Potential use environment
 - Typical workday
 - Current solutions
 - Frustrations with existing systems
 - Relevant relationships with others

Check For Completeness

- Merge or separate personas
- Fill in gaps
- Insure distinctness and completeness

Develop Narratives

- Third person narrative
- One to two pages
- Not a short story
- Introduces persona
- Sketches a day in the life
- Expresses personas product expectations

Designate Types

- Primary Personas
- Secondary Personas
- Supplemental Personas
- Customer Personas
- Served Personas
- Negative Personas

Primary Personas

- Primary target for interface design
- Multiple interfaces for multiple primary personas are possible
- Not satisfied by designs targeted to any other persona
- Compare goals of different personas

Secondary Personas

- May be satisfied by 1 or 2 additions
- Address needs without impeding primary
- Typically, 0 - 2

Supplemental Personas

- Satisfied by primary personas' interface
- May be peripheral stakeholders

Customer Personas

- Not end users
- Treated as secondary
- May be primary personas

Served Personas

- Not product users
- Directly affected by product's use
- Served by interface

Negative Personas

- Non-users
- Purely rhetorical
- Communicates who is not the design target

Other Models

- Workflow or sequence reflect
 - Process initiation
 - Information produced and consumed
 - Decisions
 - Actions

Other Models

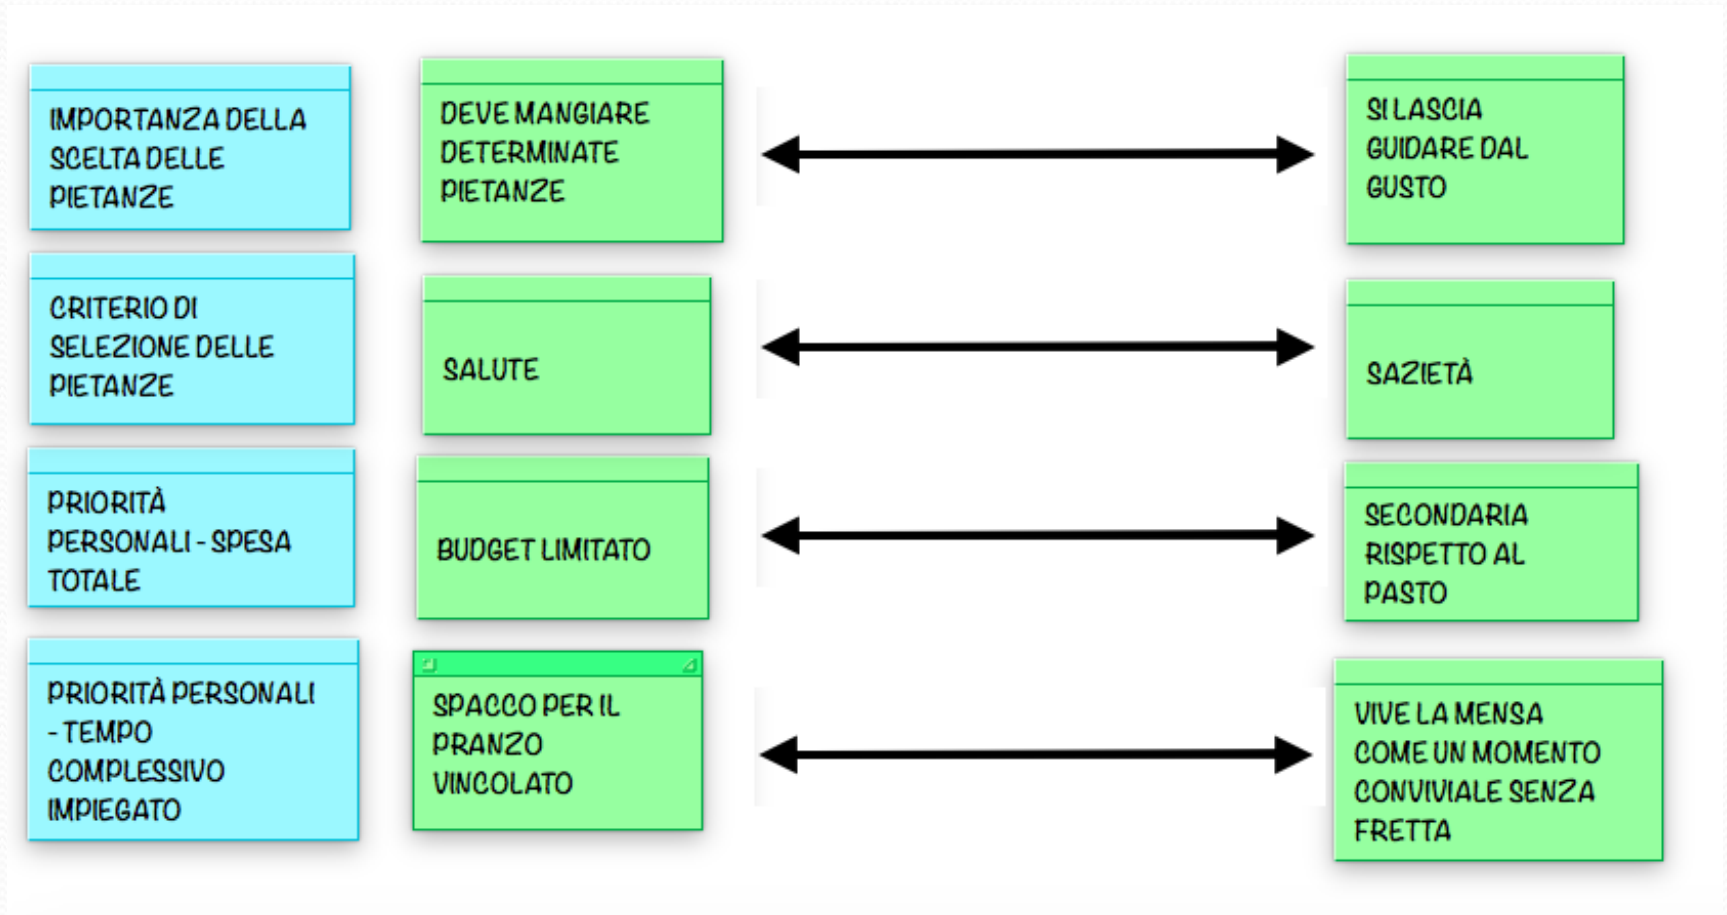

- Artifact models
 - Online or paper forms
 - Capture commonalities and differences
 - Useful to ID best practices
- Physical models
 - Focus on layout

Esercitiamoci sulle variabili comportamentali...

Considerando l'esercizio sulla palestra che avete svolto con l'esercitazione della scorsa settimana e concentratevi su una delle attività che avete preso in considerazione,

- pensate a un insieme di 6 amici che conoscete bene
- provate a identificare un insieme di variabili comportamentali significative, rispetto al task che avete scelto (es. pianificazione delle attività) e
- collocate i 6 amici nello schema tracciato
- individuate eventuali cluster. Ce n'è uno che può essere associato alla persona che avete già creato?

Es. scelta della pietanza a mensa

PRIMO STEP: DETERMINARE IL CONTESTO TARGET PER IL VOSTRO PROGETTO

Siete liberi di scegliere il dominio ma **dovrete assicurarvi:**

- di non essere già voi esperti del dominio e di avere modo di “apprendere” dagli esperti e di poter procedere con un **approccio di participatory design**, potendo contare su tali esperti (gli stakeholder del dominio cui vi state rivolgendo)
- di osservare e indirizzarvi verso un **ambiente collaborativo**, all'interno del quale cioè alcune attività vengono svolte in collaborazione tra più operatori.
- che l'**inclusione** sia uno degli obiettivi del vostro design.
- ma pensate anche al **More-than-Human**: *human conditions entangled with other living beings, materiality, technology and the environment*

ANALISI DEL PROBLEMA: primo assignment di progetto

- Prima di partire, segnalate la **composizione del vostro gruppo** rispondendo nella piattaforma di e-learning
- Per il primo assignment seguirete le indicazioni che trovate nel documento « Assignment_Analisi del Problema» sulla piattaforma e di cui parliamo oggi.
